During 70s, there was an increasing concern about the climate change. The main cause behind this concern was the extreme climatologic phenomenon like the drought which invaded Africa, along with the more important factor which is the effects of human activities on the global climate.

The main aim of this study is to shed some light over the problem of the climate change specifically created by human activities which actually constitutes a real threat to the human life in this century, and trying to put some guidelines to limit its negative effects on UAE.

In this study greenhouse definition and its effect was given. The hazards on the climate and the environment and how to deal with the climate change in the UAE were also covered.

In order to accommodate the global climate change or at least to reduce its adverse effects on UAE, the study outlines a strategic recommendations and a national environmental policy which might be able to modulate with the Kyoto Protocol.
